

DeepStream awarded ISO 27001 certification as part of ongoing commitment to information security

28 March 2019

Information security is an ever-growing business problem. Taking a risk-based approach is fundamental in ensuring modern information security measures remain effective. Here at Deepstream we want to ensure that we aren't putting you and your business at risk by not implementing the appropriate safeguards.

This is why we have been aiming for ISO 27001 accreditation – the global standard in information asset security. The standard is a systematic examination of an organisation's information security risks, taking account of the threats, vulnerabilities and impacts unique to the organisation in question.

We are thrilled to announce we have achieved the accredited certification to ISO 27001, demonstrating our organisation is following information security best practices.

Shane Dowling, CTO, commented: "Information security is of the utmost importance to both us and our customers. Securing the ISO 27001 standard demonstrates our dedication to both security and best practice within our industry."

We want our customers, business partners and investors to know that we are committed to maintaining an overarching management process. This will ensure our information security controls continue to meet the organisation's needs on an ongoing basis.
